IMPRINTS ARCHITECTS

Just like a thumbprint is unique to each person, similarly our designs are visual reflection of our client's beliefs and personality. We specialize concepts and theme based designs; a new approach to meaningful design. Steel is a material which provides the opportunity to make complex forms and structures. It is cost effective due to its less construction time, it provides large span with less diameter columns and beams thus providing a visually lighter structure. Steel is environment friendly as it does not need cement or concrete thus not affecting the air purity and no toxins, it helps to conserve the good soil in opposition to concrete and we don't need to cut trees as in wooden construction. Trees and plants as well as ground water are conserved as soil is not infused with chemical toxins. Steel is perfect to create beautiful structures that seamlessly merge with nature.

Client:

Altera, Hiranandani

Architect:

Imprints Architects

Structural Consultant:

Suyog Tikle

Construction:

Subhash Bosale

STEEL GLASS HOUSE, KHAN- DALA, MAHARASHTRA

We believe in an organic growth of a design and for that we value the importance of knowing our clients. In our first meeting with the client, they fill up a form addressing their beliefs, hobbies, dreams, vision for the project apart from their functional requirements. No information for us is silly and every raw idea is heard seriously. In the beautiful hills of khandala, nature is so close to us that, one would want to avoid any visual obstacle and enjoy an endless view. To provide a shelter in this was our challenge which we achieved through steel.
